Python Lessons

Structured lessons from basics to advanced topics.

Search lessons...

All | Basics | Intermediate | Advanced

Getting Started with Python

Learn what Python is, why it's popular, and write your first program.

Basics | Beginner | 8 min

Variables and Data Types

Store data with variables and understand Python's core data types.

Basics | Beginner | 10 min

Control Flow

Make decisions with if/else and repeat actions with loops.

Basics | Beginner | 12 min

Functions

Write reusable blocks of code with parameters and return values.

Intermediate | Intermediate | 12 min

Data Structures

Master lists, tuples, dictionaries, and sets — Python's core collections.

Intermediate | Intermediate | 14 min

Object-Oriented Programming

Model real-world concepts with classes, objects, and inheritance.

Advanced | Advanced | 16 min

Getting Started with Python

Learn what Python is, why it's popular, and write your first program.

Getting Started with Python

Python is one of the most popular programming languages in the world — and for good reason. Its clean, readable syntax makes it perfect for beginners, while its power and versatility make it a favorite of professionals.

Why Learn Python?

- **Readable**: Python's syntax reads almost like English
- **Versatile**: Used for web development, data science, AI, automation, and more
- **Beginner-friendly**: Gentle learning curve with a huge community

Your First Program

The classic first program prints "Hello, World!". In Python, it's just one line:

```
print("Hello, World!")
```

That's it! `print()` is a **built-in function** that displays text on the screen.

Running Python

You can run Python code in several ways:

How do I write a for loop in Python?

Hello there! I'm PyMentor, and I'd be happy to help you with that.

A `for` loop in Python is used to iterate over a sequence, like a list, a string, or a range of numbers. It's a fantastic way to repeat an action for every item in a collection.

Here is a simple example of how to loop through a list of fruits:

```
fruits = ["apple", "banana", "cherry"]

for fruit in fruits:
    print(fruit)
```

How it works:

1. `fruits` is your collection.
2. `fruit` is a temporary variable that takes the value of the current item in the loop.
3. The loop runs once for every item in the list.

If you want to run a loop a specific number of times, you can use the `range()` function:
